The radial basis function approach is especially well suited for those cases. 1.1 Radial basis functions Radial basis function methods are the means to approximate the multivariate functions we wish to study in this book. That is, in concrete terms, given data in  $n$  dimensions that consist of data sites  $\{x_i\}_{i=1}^m \in \mathbb{R}^n$  and function values  $\{f_i\}_{i=1}^m =$

mations to the underlying function, even when the number of interpolation points is small. In this dissertation we begin with the existence theory of radial basis function interpolants. It is first shown that, when the radial basis function is a  $p$ -norm and  $1 < p < 2$ , interpolation is always possible when the points are all different

Chapter 1 presents background material on the established theory of radial basis function interpolation and describes the how the Fast Multipole Method may used for the fast evaluation of radial basis functions. Chapter 2 contains work published in the paper "Fast Evaluation of Radial Basis Func-

### Fast evaluation of radial basis functions: Theory and

A new method to construct such a Lyapunov function using radial basis functions is presented in this volume intended for researchers and advanced students from both dynamical systems and radial basis functions. Besides an introduction to both areas and a detailed description of the method, it contains error estimates and many examples.

### Radial Basis Function Networks: Introduction

A radial basis function (RBF) is a real-valued function whose value depends only on the distance from the origin, so that  $\phi(\mathbf{x}) = \phi(\|\mathbf{x}\|)$ ; or alternatively on the distance from some other point  $c$ , called a center, so that  $\phi(\mathbf{x}, c) = \phi(\|\mathbf{x} - c\|)$ , ...
